EMI-One - smart complete monitoring solution for IT security

As a manufacturer and system provider for large data centers and micro data centers, apraNET has developed the product EMI-One - simple, efficient and cost-effective solution for IT security for both access control and environment monitoring of cabinet and enclosure systems.

Depending on requirements, the electronic access control can be achieved externally via the web browser or locally using an RFID reader or PIN input directly on the touch-screen display.

Sensors detect and monitor a wide range of environmental parameters such as temperature, humidity, smoke, etc. By setting individual thresholds, faults can be detected and reported immediately, preventing potential system failures.

In addition to the electronic cabinet labeling, it is possible to display a "service ticket" to an authorized person via the display.

The configuration of the access control and monitoring system EMI-One is quick and easy via a web interface.
